Stability of Decic Functional Equations in Multi-Banach Spaces

¹R.Murali, and ²A.Antony Raj

Received on 28 December 2017, Accepted on 25 March 2018

ABSTRACT. In this paper, we prove the Stability of Decic Functional Equation in Multi-Banach Spaces by using fixed point technique.

1. INTRODUCTION

In 1940, Ulam posed a problem concerning the stability of functional equations: Give conditions in order for a linear function near an approximately linear function to exist. An earlier work was done by Hyers [6] in order to answer Ulam's equation [15] on approximately additive mappings.

During last decades various stability problems for large variety of functional equations have been investigated by several mathematicians. A large list of references concerning in the stability of functional equations can be found.

e.g. ([1], [2], [6], [7], [9]).

In 2010, Liguang Wang, Bo Liu and ran Bai [10] proved the stability of a mixed type functional equations on Multi - Banach Spaces. In 2010, Tian Zhou Xu, John Michael Rassias, Wan Xin Xu [14] investigated the generalized Ulam-Hyers stability of the general mixed additive-quadratic-cubic-quartic functional equation

$$f(x+ny) + f(x-ny) = n^2 f(x+y) + n^2 f(x-y) + 2(1-n^2)f(x) \\ + \frac{n^4 - n^2}{12} [f(2y) + f(-2y) - 4f(y) - 4f(-y)]$$

for fixed integers n with $n \neq 0, \pm 1$ in Multi- Banach Spaces.

In 2011, Zhihua Wang, Xiaopei Li and Th. M. Rassias [17] proved the Hyers - Ulam stability of the additive - cubic - quartic functional equations

$$11[f(x+2y) + f(x-2y)] = 44[f(x+y) + f(x-y)] + 12f(3y) \\ - 48f(2y) + 60f(y) - 66f(x)$$

in Multi - Banach Spaces by using fixed point method.

In 2013, Fridoun Moradlou [5] proved the generalized Hyers-Ulam-Rassias stability of the Euler-Lagrange-Jensen Type Additive mapping in Multi-Banach Spaces.

In 2015, Xiuzhong Yang, Lidan Chang, Guofen Liu [16] established the orthogonal stability of mixed additive-quadratic jensen type functional equation in Multi-Banach Spaces.

In 2016, John M. Rassias, M. Arunkumar, E. Sathya and T. Namachivayam [8] established the general solution and also proved the stability of the nonic functional equations

$$f(x+5y) - 9f(x+4y) + 36f(x+3y) - 84f(x+2y) + 126f(x+y) - 126f(x) \\ + 84f(x-y) - 36f(x-2y) + 9f(x-3y) - f(x-4y) = 9!f(y)$$

where $9! = 362880$ in Felbin's type fuzzy normed space and intuitionistic fuzzy normed space using direct and fixed point method.

In 2016, Mohan Arunkumar, Abasalt Bodaghi, John Michael Rassias and Elumalai Sathya [12] proved the general solution of (1) and also proved the stability in Banach spaces, generalized 2-normed spaces and random normed spaces by using direct and fixed point approach.

In this paper, we carry out the following Stability of Decic Functional Equations

$$\begin{aligned}\mathcal{G}f(x, y) = & f(x + 5y) - 10f(x + 4y) + 45f(x + 3y) - 120f(x + 2y) \\ & + 210f(x + y) - 252f(x) + 210f(x - y) - 120f(x - 2y) \\ & + 45f(x - 3y) - 10f(x - 4y) + f(x - 5y) - 10!f(y)\end{aligned}\quad (1)$$

where $10! = 3628800$ in Multi-Banach Spaces by using fixed point technique.

thm 1.1. [3], [13] *Let $(\mathcal{X}, d)$ be a complete generalized metric space and let $\mathcal{J} : \mathcal{X} \rightarrow \mathcal{X}$ be a strictly contractive mapping with Lipschitz constant $\mathcal{L} < 1$. Then for each given element $x \in \mathcal{X}$, either*

$$d(\mathcal{J}^n x, \mathcal{J}^{n+1} x) = \infty$$

for all nonnegative integers n or there exists a positive integer n_0 such that

- (i) $d(\mathcal{J}^n x, \mathcal{J}^{n+1} x) < \infty$ for all $n \geq n_0$;*
- (ii) The sequence $\{\mathcal{J}^n x\}$ is convergent to a fixed point y^* of $\mathcal{J}$;*
- (iii) y^* is the unique fixed point of T in the set $Y = \{y \in X : d(\mathcal{J}^{n_0} x, y) < \infty\}$;*
- (iv) $d(y, y^*) \leq \frac{1}{1-\mathcal{L}} d(y, \mathcal{J}y)$ for all $y \in Y$.*

Now, let us recall regarding some concepts in Multi-Banach spaces.

Let $(\wp, \|\cdot\|)$ be a complex normed space, and let $k \in \mathbb{N}$. We denote by $\wp^k$ the linear space $\wp \oplus \wp \oplus \wp \oplus \cdots \oplus \wp$ consisting of k -tuples $(x_1, \dots, x_k)$ where $x_1, \dots, x_k \in \wp$. The linear operations on $\wp^k$ are defined coordinate wise. The zero element of either $\wp$ or $\wp^k$ is denoted by 0. We denote by $\mathbb{N}_k$ the set $\{1, 2, \dots, k\}$ and by Ψ_k the group of permutations on k symbols.

Definition 1.2. [4] A Multi- norm on $\{\wp^k : k \in \mathbb{N}\}$ is a sequence $(\|\cdot\|) = (\|\cdot\|_k : k \in \mathbb{N})$ such that $\|\cdot\|_k$ is a norm on $\wp^k$ for each $k \in \mathbb{N}$, $\|x\|_1 = \|x\|$ for each $x \in \wp$, and the following axioms are satisfied for each $k \in \mathbb{N}$ with $k \geq 2$:

- (1) $\|(x_{\sigma(1)}, \dots, x_{\sigma(k)})\|_k = \|(x_1 \cdots x_k)\|_k$, for $\sigma \in \Psi_k, x_1, \dots, x_k \in \wp$;
- (2) $\|(\alpha_1 x_1, \dots, \alpha_k x_k)\|_k \leq (\max_{i \in \mathbb{N}_k} |\alpha_i|) \|(x_1 \cdots x_k)\|_k$
for $\alpha_1 \cdots \alpha_k \in \mathbb{C}, x_1, \dots, x_k \in \wp$;
- (3) $\|(x_1, \dots, x_{k-1}, 0)\|_k = \|(x_1, \dots, x_{k-1})\|_{k-1}$, for $x_1, \dots, x_{k-1} \in \wp$;

$$(4) \|(x_1, \dots, x_{k-1}, x_{k-1})\|_k = \|(x_1, \dots, x_{k-1})\|_{k-1} \text{ for } x_1, \dots, x_{k-1} \in \wp.$$

In this case, we say that $((\wp^k, \|\cdot\|_k) : k \in \mathbb{N})$ is a multi - normed space.

Suppose that $((\wp^k, \|\cdot\|_k) : k \in \mathbb{N})$ is a multi - normed spaces, and take $k \in \mathbb{N}$. We need the following two properties of multi - norms. They can be found in [4].

$$(a) \|(x, \dots x)\|_k = \|x\|, \text{ for } x \in \wp,$$

$$(b) \max_{i \in \mathbb{N}_k} \|x_i\| \leq \|(x_1, \dots, x_k)\|_k \leq \sum_{i=1}^k \|x_i\| \leq k \max_{i \in \mathbb{N}_k} \|x_i\|, \text{ for } x_1, \dots, x_k \in \wp.$$

It follows from (b) that if $(\wp, \|\cdot\|)$ is a Banach space, then $(\wp^k, \|\cdot\|_k)$ is a Banach space for each $k \in \mathbb{N}$; In this case, $((\wp^k, \|\cdot\|_k) : k \in \mathbb{N})$ is a multi - Banach space.

thm 1.3. *Let $\mathcal{X}$ be an linear space and let $((\mathcal{Y}^k, \|\cdot\|) : K \in \mathbb{N})$ be a multi-Banach space. Suppose that δ is a nonnegative real number and $f : \mathcal{X} \rightarrow \mathcal{Y}$ is a mapping satisfying*

$$\sup_{k \in \mathbb{N}} \|(\mathcal{G}f(x_1, y_1), \dots, \mathcal{G}f(x_1, y_1))\|_k \leq \delta \quad (2)$$

$x_1, \dots, x_k, y_1, \dots, y_k \in \mathcal{X}$. Then there exists a unique decic mapping $\mathcal{D} : \mathcal{X} \rightarrow \mathcal{Y}$ such that

$$\sup_{k \in \mathbb{N}} \|(f(x_1) - \mathcal{D}(x_1), \dots, f(x_k) - \mathcal{D}(x_k))\|_k \leq \frac{41}{148490496} \delta \quad (3)$$

for all $x_1, \dots, x_k \in \mathcal{X}$.

Proof. Letting $x_1 = x_2 = \dots = x_k = 0$ and replacing $y_1, \dots, y_k$ by $2x_1, \dots, 2x_k$ in (2), we obtain that

$$\sup_{k \in \mathbb{N}} \|(2f(10x_1) - 20f(8x_1) + 90f(6x_1) - 240f(4x_1) - 3628380f(2x_1), \dots, \\ 2f(10x_k) - 20f(8x_k) + 90f(6x_k) - 240f(4x_k) - 3628380f(2x_k))\|_k \leq \delta \quad (4)$$

for all $x_1, \dots, x_k \in \mathcal{X}$.

Dividing by 2 in the above equation, we get

$$\sup_{k \in \mathbb{N}} \|(f(10x_1) - 10f(8x_1) + 45f(6x_1) - 120f(4x_1) - 1814190f(2x_1), \dots, \\ f(10x_k) - 10f(8x_k) + 45f(6x_k) - 120f(4x_k) - 1814190f(2x_k))\|_k \leq \frac{1}{2} \delta \quad (5)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Again we taking $x_1, \dots, x_k$ by $5y_1, \dots, 5y_k$ and replacing $y_1, \dots, y_k$ by $x_1, \dots, x_k$ in (2), we get

$$\begin{aligned} \sup_{k \in \mathbb{N}} & \| (f(10x_1) - 10f(9x_1) + 45f(8x_1) - 120f(7x_1) + 210f(6x_1) - 252f(5x_1) \\ & + 210f(4x_1) - 120f(3x_1) + 45f(2x_1) - 3628810f(x_1), \dots, f(10x_k) \\ & - 10f(9x_k) + 45f(8x_k) - 120f(7x_k) + 210f(6x_k) - 252f(5x_k) \\ & + 210f(4x_k) - 120f(3x_k) + 45f(2x_k) - 3628810f(x_k)) \|_k \leq \delta \quad (6) \end{aligned}$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Unifying (5) and (6),

$$\begin{aligned} \sup_{k \in \mathbb{N}} & \| (10f(9x_1) - 55f(8x_1) + 120f(7x_1) - 165f(6x_1) + 252f(5x_1) \\ & - 330f(4x_1) + 120f(3x_1) - 1814235f(2x_1) + 3628810f(x_1), \\ & \dots, 10f(9x_k) - 55f(8x_k) + 120f(7x_k) - 165f(6x_k) + 252f(5x_k) \\ & - 330f(4x_k) + 120f(3x_k) - 1814235f(2x_k) + 3628810f(x_k)) \|_k \leq \frac{3}{2}\delta \quad (7) \end{aligned}$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Letting $x_1, \dots, x_k$ by $4x_1, \dots, 4x_k$ and replacing $y_1, \dots, y_k$ by $x_1, \dots, x_k$ in (2), we arrive

$$\begin{aligned} \sup_{k \in \mathbb{N}} & \| (f(9x_1) - 10f(8x_1) + 45f(7x_1) - 120f(6x_1) + 210f(5x_1) - 252f(4x_1) \\ & + 210f(3x_1) - 120f(2x_1) + 3628754f(x_1), \dots, f(9x_k) - 10f(8x_k) \\ & + 45f(7x_k) - 120f(6x_k) + 210f(5x_k) - 252f(4x_k) + 210f(3x_k) \\ & - 120f(2x_k) - 3628754f(x_k)) \|_k \leq \delta \quad (8) \end{aligned}$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Multiplying by 10 in (8), we arrive

$$\begin{aligned} \sup_{k \in \mathbb{N}} & \| (10f(9x_1) - 100f(8x_1) + 450f(7x_1) - 1200f(6x_1) + 2100f(5x_1) \\ & - 2520f(4x_1) + 2100f(3x_1) - 1200f(2x_1) - 36287540f(x_1), \dots, 10f(9x_k) \\ & - 100f(8x_k) + 450f(7x_k) - 1200f(6x_k) + 2100f(5x_k) \\ & - 2520f(4x_k) + 2100f(3x_k) - 1200f(2x_k) - 36287540f(x_k)) \|_k \leq 10\delta \quad (9) \end{aligned}$$

for all $x_1, \dots, x_k \in \mathcal{X}$. It folloys from (7) and (9), ye get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(45f(8x_1) - 330f(7x_1) + 1035f(6x_1) - 1848f(5x_1) + 2190f(4x_1) \\ - 1980f(3x_1) - 1813035f(2x_1) + 39916350f(x_1), \dots, 45f(8x_k) \\ - 330f(7x_k) + 1035f(6x_k) - 1848f(5x_k) + 2190f(4x_k) - 1980f(3x_k) \\ - 1813035f(2x_k) + 39916350f(x_k))\|_k \leq \frac{23}{2}\delta \end{aligned} \quad (10)$$

for all $x_1, \dots, x_k \in \mathcal{X}$.

Putting $x_1, \dots, x_k$ by $3x_1, \dots, 3x_k$ and replacing $y_1, \dots, y_k$ by $x_1, \dots, x_k$ in (2), we get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(f(8x_1) - 10f(7x_1) + 45f(6x_1) - 120f(5x_1) + 210f(4x_1) - 252f(3x_1) \\ + 211f(2x_1) - 3628930f(x_1), \dots, f(8x_k) - 10f(7x_k) + 45f(6x_k) - 120f(5x_k) \\ + 210f(4x_k) - 252f(3x_k) + 211f(2x_k) - 3628930f(x_k))\|_k \leq \delta \end{aligned} \quad (11)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Multiplying by 45 in (11), we get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(45f(8x_1) - 450f(7x_1) + 2025f(6x_1) - 5400f(5x_1) + 9450f(4x_1) \\ - 11340f(3x_1) + 9495f(2x_1) - 163301850f(x_1), \dots, 45f(8x_k) \\ - 450f(7x_k) + 2025f(6x_k) - 5400f(5x_k) + 9450f(4x_k) - 11340f(3x_k) \\ + 9495f(2x_k) - 163301850f(x_k))\|_k \leq 45\delta \end{aligned} \quad (12)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. By (10) and (12), we obtain

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(120f(7x_1) - 990f(6x_1) + 355f(5x_1) - 7260f(4x_1) + 9360f(3x_1) \\ - 1822530f(2x_1) + 203218200f(x_1), \dots, 120f(7x_k) - 990f(6x_k) + 355f(5x_k) \\ - 7260f(4x_k) + 9360f(3x_k) - 1822530f(2x_k) + 203218200f(x_k))\|_k \leq \frac{113}{2}\delta \end{aligned} \quad (13)$$

for all $x_1, \dots, x_k \in \mathcal{X}$.

Replacing $x_1, \dots, x_k$ by $2x_1, \dots, 2x_k$ and $y_1, \dots, y_k$ by $x_1, \dots, x_k$ in (2), we get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(f(7x_1) - 10f(6x_1) + 45f(5x_1) - 120f(4x_1) + 211f(3x_1) - 262f(2x_1) \\ + 3628545f(x_1), \dots, f(7x_k) - 10f(6x_k) + 45f(5x_k) - 120f(4x_k) \\ + 211f(3x_k) - 262f(2x_k) - 3628545f(x_k))\|_k \leq \delta \end{aligned} \quad (14)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Multiplying by 120 on both sides in (14), we can get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(120f(7x_1) - 1200f(6x_1) + 5400f(5x_1) - 14400f(4x_1) + 25320f(3x_1) \\ - 31440f(2x_1) - 435425400f(x_1), \dots, 120f(7x_k) - 1200f(6x_k) + 5400f(5x_k) \\ - 14400f(4x_k) + 25320f(3x_k) - 31440f(2x_k) - 435425400f(x_k))\|_k \leq 120\delta \end{aligned} \quad (15)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. By (13) and (15), we get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(210f(6x_1) - 1848f(5x_1) + 7140f(4x_1) - 15960f(3x_1) - 1791090f(2x_1) \\ + 638643600f(x_1), \dots, 210f(6x_k) - 1848f(5x_k) + 7140f(4x_k) \\ - 15960f(3x_k) - 1791090f(2x_k) + 638643600f(x_k))\|_k \leq \frac{353}{2}\delta \end{aligned} \quad (16)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Dividing on both sides by 2 in (16), we get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(105f(6x_1) - 924f(5x_1) + 3570f(4x_1) - 7980f(3x_1) - 895545f(2x_1) \\ + 319321800f(x_1), \dots, 105f(6x_k) - 924f(5x_k) + 3570f(4x_k) \\ - 7980f(3x_k) - 895545f(2x_k) + 319321800f(x_k))\|_k \leq \frac{353}{4}\delta \end{aligned} \quad (17)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Replacing $y_1, \dots, y_k$ by $x_1, \dots, x_k$ in (2), we get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(f(6x_1) - 10f(5x_1) + 46f(4x_1) - 130f(3x_1) + 255f(2x_1) \\ - 3629172f(x_1), \dots, f(6x_k) - 10f(5x_k) + 46f(4x_k) - 130f(3x_k) \\ + 255f(2x_k) - 3629172f(x_k))\|_k \leq \delta \end{aligned} \quad (18)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Multiplying both sides 105 by (18), we can get

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(105f(6x_1) - 1050f(5x_1) + 4830f(4x_1) - 13650f(3x_1) + 26775f(2x_1) \\ - 381063060f(x_1), \dots, 105f(6x_k) - 1050f(5x_k) + 4830f(4x_k) \\ - 13650f(3x_k) + 26775f(2x_k) - 3810630f(x_k))\|_k \leq 105\delta \end{aligned} \quad (19)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. From (17) and (19)

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(126f(5x_1) - 1260f(4x_1) + 5670f(3x_1) - 922320f(2x_1) \\ + 700384860f(x_1) + 126f(5x_k) - 1260f(4x_k) + 5670f(3x_k) \\ - 922320f(2x_k) + 700384860f(x_k))\|_k \leq \frac{773}{4}\delta \end{aligned} \quad (20)$$

for all $x_1, \dots, x_k \in \mathcal{X}$.

Replacing $x_1, \dots, x_k = 0$ and $y_1, \dots, y_k$ by $x_1, \dots, x_k$ in (2), we obtain

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(2f(5x_1) - 20f(4x_1) + 90f(3x_1) - 240f(2x_1) + \\ - 3628380f(x_1), \dots, 2f(5x_k) - 20f(4x_k) + 90f(3x_k) - 240f(2x_k) \\ - 3628380f(x_k))\|_k \leq \delta \end{aligned} \quad (21)$$

for all $x_1, \dots, x_k \in \mathcal{X}$.

Multiplying on bothsides by 65 in (21), we obtain that

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(126f(5x_1) - 1260f(4x_1) + 5670f(3x_1) - 15120f(2x_1) - 228587940f(x_1) \\ 126f(5x_k) - 1260f(4x_k) + 5670f(3x_k) - 15120f(2x_k) - 228587940f(x_k))\|_k \leq 63\delta \end{aligned} \quad (22)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. From (20) and (22)

$$\begin{aligned} \sup_{k \in \mathbb{N}} \|(-907200f(2x_1) + 928972800f(x_1), \dots, \\ -907200f(2x_k) + 928972800f(x_k))\|_k \leq \frac{1025}{4}\delta \end{aligned} \quad (23)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. It follows from (23)that

$$\sup_{k \in \mathbb{N}} \|(f(2x_1) - 1024f(x_1), \dots, f(2x_k) - 1024f(x_k))\|_k \leq \frac{205}{725760}\delta \quad (24)$$

$$\sup_{k \in \mathbb{N}} \left\| \left(f(x_1) - \frac{f(2x_1)}{2^{10}}, \dots, f(x_k) - \frac{f(2x_k)}{2^{10}} \right) \right\|_k \leq \frac{41}{148635648} \delta \quad (25)$$

for all $x_1, \dots, x_k \in \mathcal{X}$. Let $\Lambda = \{g : \mathcal{X} \rightarrow \mathcal{A} | g(0) = 0\}$ and introduce the generalized metric d defined on Λ by

$$d(o, p) = \inf \left\{ \lambda \in [0, \infty] \mid \sup_{k \in \mathbb{N}} \|o(x_1) - p(x_1), \dots, o(x_k) - p(x_k)\|_k \leq \lambda \quad \forall x_1, \dots, x_k \in \mathcal{X} \right\}$$

Then it is easy to show that (Λ, d) is a generalized complete metric space, See [11].

we define an operator $\mathcal{J} : \Lambda \rightarrow \Lambda$ by

$$\mathcal{J}o(x) = \frac{1}{2^{10}} o(2x) \quad x \in \mathcal{X}.$$

we assert that $\mathcal{J}$ is a strictly contractive operator. Given $o, p \in \Lambda$, let $\lambda \in [0, \infty]$ be an arbitrary constant with $d(o, p) \leq \lambda$. From the definition it follows that

$$\sup_{k \in \mathbb{N}} \|o(x_1) - p(x_1), \dots, o(x_k) - p(x_k)\|_k \leq \lambda \quad x_1, \dots, x_k \in \mathcal{X}.$$

Therefore,

$$\begin{aligned} & \sup_{k \in \mathbb{N}} \|(\mathcal{J}o(x_1) - \mathcal{J}p(x_1), \dots, \mathcal{J}o(x_k) - \mathcal{J}p(x_k))\|_k \\ & \leq \sup_{k \in \mathbb{N}} \left\| \left(\frac{1}{2^{10}} o(2x_1) - \frac{1}{2^{10}} p(2x_1), \dots, \frac{1}{2^{10}} o(2x_k) - \frac{1}{2^{10}} p(2x_k) \right) \right\|_k \\ & \leq \frac{1}{2^{10}} \lambda \end{aligned}$$

$x_1, \dots, x_k \in \mathcal{X}$. Hence, it holds that

$$d(\mathcal{J}o, \mathcal{J}p) \leq \frac{1}{2^{10}} \lambda d(\mathcal{J}o, \mathcal{J}p) \leq \frac{1}{2^{10}} d(o, p)$$

$\forall o, p \in \Lambda$.

This means that $\mathcal{J}$ is a strictly contractive operator on Λ with the Lipschitz constant $L = \frac{1}{2^{10}}$.

By (25), we have $d(\mathcal{J}f, f) \leq \frac{41}{148635648} \delta$. According to Theorem 1.1, we deduce the existence of a fixed point of $\mathcal{J}$ that is the existence of mapping $\mathcal{D} : \mathcal{X} \rightarrow \mathcal{A}$ such that

$$\mathcal{D}(2x) = 2^{10} \mathcal{D}(x) \quad \forall x \in \mathcal{X}.$$

Moreover, we have $d(\mathcal{J}^n f, \mathcal{D}) \rightarrow 0$, which implies

$$\mathcal{D}(x) = \lim_{n \rightarrow \infty} \mathcal{J}^n f(x) = \lim_{n \rightarrow \infty} \frac{\xi(2^n x)}{2^{10n}}$$

for all $x \in \mathcal{X}$.

Also, $d(f, \mathcal{D}) \leq \frac{1}{1-L} d(\mathcal{J}f, f)$ implies the inequality

$$\begin{aligned} d(f, \mathcal{D}) &\leq \frac{1}{1 - \frac{1}{2^{10}}} d(\mathcal{J}f, f) \\ &\leq \frac{41}{148490496} \delta. \end{aligned}$$

Setting $x_1 = \dots, x_k = 2^n x, y_1 = \dots, y_k = 2^n y$ in (2) and divide both sides by 2^{10n} . Then, using property (a) of multi-norms, we obtain

$$\begin{aligned} \|\mathcal{GD}(x, y)\| &= \lim_{n \rightarrow \infty} \frac{1}{2^{10n}} \|\mathcal{G}f(2^n x, 2^n y)\| \\ &\leq \lim_{n \rightarrow \infty} \frac{1}{2^{10n}} = 0 \end{aligned}$$

for all $x, y \in \mathcal{X}$. Hence $\mathcal{D}$ is Decic.

The uniqueness of $\mathcal{D}$ follows from the fact that $\mathcal{D}$ is the unique fixed point of $\mathcal{J}$ with the property that there exists $\ell \in (0, \infty)$ such that

$$\sup_{k \in \mathbb{N}} \|(f(x_1) - \mathcal{D}(x_1), \dots, f(x_k) - \mathcal{D}(x_k))\|_k \leq \ell$$

for all $x_1, \dots, x_k \in \mathcal{X}$.

This completes the proof of the Theorem. □
